

Executive Summary

User Churn Project | Exploratory Data Analysis

Prepared for: Waze Leadership Team

OVERVIEW

The Waze data team is currently developing a data analytics project aimed at increasing overall growth by preventing monthly user churn on the Waze app. Data team is required to perform Exploratory Data Analysis to provide insights from the dataset, prepare, and validate it for future ML models.

PROJECT STATUS

- Preliminary EDA is complete.
- Once concerns & questions regarding the data source is answered, ML model construction commences.

NEXT STEPS

- Questions regarding data:
 - Data-related questions need to be asked from the data team regarding 2nd insight.
 - It should also be investigated by the data team why more than 40 % of app usages are done in the last month, despite sign ups having been done years ago!
 - Reasons why `drives_avg_speed_kmph` is extremely heavily tailed above 300 kmph!
- Once concerns & questions regarding the data source is answered, ML model construction commences.

KEY INSIGHTS

- number of driving days and app usage days are roughly uniformly distributed, however app usage days among churned users is concentrated on much less days.
- Observations related to mileage are right-skewed, there are exceptional drivers with driving huge distances.
- Churn rate = 17% , Retention rate = 83%
- Device type has no effect on churn rate.
- `km_per_driving_day` is significantly larger among churned users, where their `driving_days` much less than the rest of users.
